The circuit board is defective. The circuit board manages all your dishwasher's functions (motor, heating, water, etc.). It controls whether or not the appliance heats up and whether it dries the items you have loaded inside it. If you have already checked all the parts described above, the fault may actually lie with the circuit board.

Regenerative braking is an energy recovery mechanism that slows down a moving vehicle or object by converting its kinetic energy into a form that can be either used immediately or stored until needed. In this mechanism, the electric traction motor uses the vehicle's momentum to recover energy that would otherwise be lost to the brake discs as heat.

The water cooling was usually closed-circuit, so no water loss would occur unless there was a leak. If the cooling water ran low, the engine would seize through overheating — a major problem, but it carried no danger of explosion. Compared with steam, petrol (Otto-cycle), and compression-ignition (Diesel-cycle) engines, hot-bulb engines are simpler, and therefore have fewer potential ...
